

REALGG – Nomalisation

Nomalisation

For this assignment we design our database using five tables, even though we did not show the full 1NF, 2NF, NF process, we still made sure the design follows nomalisation ideas according to new requirement.

Here are the our points:

- Each table can keeps one type sof information.
- There are no repeating values in any column.
- Every column has only one value.
- There is no duplicated data across tables.
- We use primary keys and foreign keys to connect the tables.
- The table ShowGenre works as a middle table so that one show can have many genres without repeating show data
